

Finding my philosophy

We live in an interesting time for technology. While many years ago, technology served as a point of community for people, where experiences were shared and new ideas were born, the soul has been removed from much of tech. What once was a new frontier that brought inspiration and togetherness now serves as another tool in a world where people separate themselves at every opportunity. Gone are the days of the family PC, in are the days of the family alone on their phones.

However, it really isn't too late to stop it. I believe in using my technical skills to restore an era of the internet as a community for those who want and enjoy it. For those who don't think it's too late. My fondest memories as a child are those of technology being what brought us together, whether it was me and my dad on the Windows ME computer playing Warcraft II (even though I was 4 and didn't understand anything) or whether it was how TV on the CRT really did feel so different than Netflix on a phone.

My philosophy believes that we don't have to head toward a soulless future where technology really does just turn into oppression, but that freedom and creativity still exist within tech. It's not just about aesthetics (although UI design has fallen off along with the soul of tech), it's also about the passion and heart of the people making software. My philosophy believes that people do have the heart to stop the collapse of good tech, with just a little bit more care. My philosophy is that I will do everything I can to restore hope and happiness to an industry that is having it sucked out of it, no matter how small my role in it may be. If you're caring enough to read this, I hope you will too. :)

Kind regards,

Aspen
